HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L’archive ouverte pluridisciplinaire HAL, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d’enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.
AN EXTENSION OF BIFRACTIONAL BROWNIAN MOTION

XAVIER BARDINA* AND KHALIFA ES-SEBAIY

Abstract. In this paper we introduce and study a self-similar Gaussian process that is the bifractional Brownian motion \( B_{H,K} \) with parameters \( H \in (0,1) \) and \( K \in (1,2) \) such that \( HK \in (0,1) \). A remarkable difference between the case \( K \in (0,1) \) and our situation is that this process is a semimartingale when \( 2HK = 1 \).

1. Introduction

Houdré and Villa in [7] gave the first introduction to the bifractional Brownian motion (bifBm) \( B_{H,K} = (B_{t}^{H,K}; t \geq 0) \) with parameters \( H \in (0,1) \) and \( K \in (0,1] \) which is defined as a centered Gaussian process, with covariance function

\[
R_{H,K}(t,s) = E\left(B_{t}^{H,K}B_{s}^{H,K}\right) = \frac{1}{2K}\left((t^{2H} + s^{2H})^{K} - |t-s|^{2HK}\right),
\]

for every \( s, t \geq 0 \).

The case \( K = 1 \) corresponds to the fractional Brownian motion (fBm) with Hurst parameter \( H \). Some properties of the bifractional Brownian motion have been studied by Russo and Tudor in [12]. In fact, in [12] it is shown that the bifractional Brownian motion behaves as a fractional Brownian motion with Hurst parameter \( HK \). A stochastic calculus with respect to this process has been recently developed by Kruk, Russo and Tudor [9] and Es-Sebaiy and Tudor [6].

In this paper we prove that, with \( H \in (0,1) \) and \( HK \in (0,1) \), the process \( B_{H,K} \) can be extended for \( 1 < K < 2 \). The case \( H = \frac{1}{2} \) and \( 1 < K < 2 \) plays a role to give an extension of sub-fractional Brownian motion (subfBm) (see [4]). The subfBm \( (\xi_{h}^{h}, t \geq 0) \) with parameter \( 0 < h \leq 2 \) is a centered Gaussian process with covariance:

\[
E\left(\xi_{t}^{h}\xi_{s}^{h}\right) = C_{h}\left(t^{2h} + s^{2h} - \frac{1}{2}((t + s)^{2h} + |t - s|^{2h})\right); \quad s, t \geq 0
\]

where \( C_{h} = 1 \) if \( 0 < h < 1 \) and \( C_{h} = 2(1 - h) \) if \( 1 < h \leq 2 \).

2. Definition of bifractional Brownian motion with parameter $K \in (1, 2)$

For any $K \in (0, 2)$, let $X^K = (X^K_t, t \geq 0)$ be a Gaussian process defined by

$$X^K_t = \int_0^\infty (1 - e^{-rt})r^{-\frac{1+K}{2}}dW_r, \quad t \geq 0$$

(2.1)

where $(W_t, t \geq 0)$ is a standard Brownian motion.

This process was introduced in [10] for $K \in (0, 1)$ in order to obtain a decomposition of the bifractional Brownian motion with $H \in (0, 1)$ and $K \in (0, 1)$. More precisely, they prove the following result:

**Theorem 2.1 (see [10]).** Let $B^{H,K}$ a bifractional Brownian motion with parameters $H \in (0, 1)$ and $K \in (0, 1)$, $B^{HK}$ be a fractional Brownian motion with Hurst parameter $HK \in (0, 1)$ and $W = \{W_t, t \geq 0\}$ a standard Brownian motion. Let $X^K$ be the process given by (2.1). If we suppose that $B^{H,K}$ and $W$ are independents, then the processes $\{Y_t = C_1X^K_{t^{2H}} + B^{H,K}_t, t \geq 0\}$ and $\{C_2B^{HK}_t, t \geq 0\}$ have the same distribution, where $C_1 = \sqrt{\frac{2-K}{1-K}}$ and $C_2 = 2^{\frac{1-K}{2}}$.

The process defined in (2.1) has good properties. The following result is proved in [10] for the case $K \in (0, 1)$ and extended to the case $K \in (1, 2)$ in [2] and [11]:

**Proposition 2.2 (see [2],[10] and [11]).** The process $X^K = \{X^K_t, t \geq 0\}$ is Gaussian, centered, and its covariance function is:

$$\text{Cov}(X^K_t, X^K_s) = \begin{cases} \frac{\Gamma(1-K)}{K(1-K)} [t^K + s^K - (t+s)^K] & \text{if } K \in (0,1), \\ \frac{\Gamma(2-K)}{K(K-1)} [(t+s)^K - t^K - s^K] & \text{if } K \in (1,2). \end{cases}$$

(2.2)

Moreover, $X^K$ has a version with trajectories which are infinitely differentiable on $(0, \infty)$ and absolutely continuous on $[0, \infty)$.

Using the fact that when $K \in (1,2)$, the covariance function of $X^K$ is given by

$$\text{Cov}(X^K_t, X^K_s) = \frac{\Gamma(2-K)}{K(K-1)} ((t+s)^K - t^K - s^K),$$

and considering also the process

$$X^{H,K}_t = X^K_{t^{2H}}, \quad t \geq 0,$$

(2.3)

we can prove the following result:

**Theorem 2.3.** Assume $H \in (0,1)$ and $K \in (1,2)$ with $HK \in (0,1)$. Let $B^{HK}$ be a fractional Brownian motion, and $W = \{W_t, t \geq 0\}$ a standard Brownian motion. Let $X^{K,H}$ the process defined in (2.3). If we suppose that $B^{HK}$ and $W$ are independents, then the processes

$$B^{H,K}_t = aB^{HK}_t + bX^{H,K}_t,$$

(2.4)

where $a = \sqrt{2-2K}$ and $b = \sqrt{\frac{K(K-1)}{2(1-K)}}$ is a centered Gaussian process with covariance function

$$E\left(B^{H,K}_t B^{H,K}_s\right) = \frac{1}{2^K} \left( (t^{2H} + s^{2H})^K - |t-s|^{2HK} \right); \quad s, \ t \geq 0.$$
Proof. It is obvious that the process defined in (2.4) is a centered Gaussian process. On the other hand, its covariance functions is given by

\[
E \left( B^{H,K}_t B^{H,K}_s \right) = a^2 E \left( B^{H,K}_t B^{H,K}_s \right) + b^2 E \left( X^{H,K}_t X^{H,K}_s \right) = \frac{1}{2^K} \left( (t^{2H} + s^{2H}) - |t - s|^{2H} \right)
\]

for all \( \xi \in B^{H,K} \), and suppose that \( H,K \notin (0,1) \).

The following decomposition is exploited to prove the quasi-helix property (in the sense of J.P. Kahane) of \( B^{H,K} \).

**Proposition 2.5.** Let \( H \in (0,1) \) and \( K \in (0,2) \) such that \( HK \in (0,1) \). Let \( (\xi_t^{K,H}, t \geq 0) \) be a sub-fractional Brownian motion with parameter \( K/2 \in (0,1) \), independent to \( B^{H,K} \) and suppose that \( (B_t^{K/2}, t \geq 0) \) and \( (B_t^{HK}, t \geq 0) \) are two independent fractional Brownian motions with Hurst parameter \( K/2 \in (0,1) \) and \( HK \in (0,1) \), respectively. We set \( \xi_t^{K,H} = \xi_t^{K/2} \) and \( \tilde{B}_t^{H,K} = B_t^{K/2} \), \( t \geq 0 \). Then, it holds that

\[
B^{H,K}_t + \sqrt{2^{1-K} \xi_t^{K,H}} \overset{d}{=} \sqrt{2^{1-K}} \left( \tilde{B}^{H,K}_t + B^{HK}_t \right)
\]

where \( \overset{d}{=} \) denotes that both processes have the same distribution.

**Proof.** The result follows easily from the independence and the fact that their corresponding covariance functions satisfy the following equality for all \( s, t \geq 0 \)

\[
R^{H,K}(t,s) = \frac{1}{2^K} \left( (t^{2H} + s^{2H}) - |t - s|^{2H} \right)
\]

Remark 2.4. Assume that \( 2HK = 1 \). Russo and Tudor [12] proved that if \( K \) belong to \((0,1)\), the process \( B^{H,K} \) is not a semimartingale. But in the case when \( 1 < K < 2 \), \( B^{H,K} \) is a semimartingale because we have a decomposition of this process as a sum of a Brownian motion \( B^{\frac{1}{2}} \) and a finite variation process \( X^{H,K} \).

The following proposition is exploited to prove the quasi-helix property (in the sense of J.P. Kahane) of \( B^{H,K} \). This result is satisfied for all \( K \in (0,2) \).

**Proposition 2.6.** Let \( H \in (0,1) \) and \( K \in (1,2) \) such that \( HK \in (0,1) \). Then for any \( t, s \geq 0 \), if \( 0 < H \leq 1/2 \)

\[
2^{1-K} |t - s|^{2HK} \leq E \left( B_t^{H,K} - B_s^{H,K} \right)^2 \leq |t - s|^{2HK},
\]

which completes the proof. \( \Box \)
and if $1/2 < H < 1$

$$2^{1-K}|t-s|^{2HK} \leq E \left( B_{t_t}^{H,K} - B_{s_t}^{H,K} \right)^2 \leq 2^{2-K}|t-s|^{2HK}.$$ 

**Proof.** Using the proposition 2.5, we obtain

$$E \left( B_{t_t}^{H,K} - B_{s_t}^{H,K} \right)^2 = 2^{1-K} \left( -E \left( \xi_{t_t}^{2HK} - \xi_{s_t}^{2HK} \right)^2 + E \left( B_{t_t}^{2HK} - B_{s_t}^{2HK} \right)^2 \right)$$

$$= 2^{1-K} \left( -E \left( \xi_{t_t}^{2HK} - \xi_{s_t}^{2HK} \right)^2 + |t^{2H} - s^{2H}|^{2K} + |t-s|^{2HK} \right).$$

On the other hand, from [3] we have

$$\left( 2 - 2^{K-1} \right) |t^{2H} - s^{2H}|^{2K} \leq E \left( \xi_{t_t}^{2HK} - \xi_{s_t}^{2HK} \right)^2 \leq |t^{2H} - s^{2H}|^{2K}.$$ 

Thus

$$2^{1-K}|t-s|^{2HK} \leq E \left( B_{t_t}^{H,K} - B_{s_t}^{H,K} \right)^2 \leq 2^{1-K} \left( |t-s|^{2HK} + (2^{K-1} - 1) |t^{2H} - s^{2H}|^{2K} \right).$$

Then we deduce that for every $H \in (0, 1)$, $K \in (1, 2)$ with $HK \in (0, 1)$

$$2^{1-K}|t-s|^{2HK} \leq E \left( B_{t_t}^{H,K} - B_{s_t}^{H,K} \right)^2$$

and the other hand for every $H \in (0, \frac{1}{2})$, $K \in (1, 2)$ we have

$$E \left( B_{t_t}^{H,K} - B_{s_t}^{H,K} \right)^2 \leq 2^{1-K} \left( |t-s|^{2HK} + (2^{K-1} - 1) |t^{2H} - s^{2H}|^{2K} \right)$$

$$\leq |t-s|^{2HK}.$$ 

The last inequality is satisfied from the fact that $|t^{2H} - s^{2H}| \leq |t-s|^{2H}$ for $H \in (0, \frac{1}{2})$. 

To complete the proof, it remains to show that for every $H \in (\frac{1}{2}, 1)$, $K \in (1, 2)$ with $HK \in (0, 1)$ (observe that in this situation we have $HK \in (\frac{1}{4}, 1)$)

$$E \left( B_{t_t}^{H,K} - B_{s_t}^{H,K} \right)^2 \leq 2^{2-K}|t-s|^{2HK}.$$ 

Notice that,

$$E \left( B_{t_t}^{H,K} - B_{s_t}^{H,K} \right)^2 = \frac{1}{2K} \left( (2t^{2H})^K + (2s^{2H})^K - 2 \left( (t^{2H} + s^{2H})^K - |t-s|^{2HK} \right) \right)$$

$$= \frac{2}{2K}|t-s|^{2HK} \left( t^{2HK} + s^{2HK} - \frac{2}{2K}(t^{2H} + s^{2H})^K \right).$$

Hence it is enough to prove that

$$t^{2HK} + s^{2HK} - \frac{2}{2K}(t^{2H} + s^{2H})^K \leq 2^{1-K}|t-s|^{2HK},$$
or equivalently
\[ t^{2HK} + s^{2HK} \leq 2^{1-K} \left( (t^{2H} + s^{2H})^K + |t - s|^{2HK} \right). \]

From now on we will assume, bethought loss of generality, that \( s \leq t \). Dividing by \( t^{2HK} \) we obtain that we have to prove that
\[ 1 + \left( \frac{s}{t} \right)^{2HK} \leq 2^{1-K} \left( 1 + \left( \frac{s}{t} \right)^{2H} \right)^K + \left( 1 - \frac{s}{t} \right)^{2HK}. \]

Equivalently we have to prove that, for any \( u \in (0,1] \) the function
\[ f(u) := 2^{1-K} \left( (1 + u^{2H})^K + (1 - u)^{2HK} \right) - u^{2HK} - 1 \]

is positive.

Observe that \( f(1) = 0 \), so, it is enough to see that the derivative of this function is negative for \( u \in (0,1] \). But,
\[ f'(u) = 2HK 2^{1-K} u^{2HK-1} \left[ \left( 1 + \frac{1}{u^{2H}} \right)^K - \left( \frac{1}{u} - 1 \right)^{2HK-1} - 2^{K-1} \right]. \]

To prove that \( f'(u) \leq 0 \) for \( u \in (0,1] \) it is enough to see that the function
\[ h(u) := \left( 1 + \frac{1}{u^{2H}} \right)^K - \left( \frac{1}{u} - 1 \right)^{2HK-1} - 2^{K-1}, \]
is negative for \( u \in (0,1] \). But, since \( h(1) = 0 \), it is enough to prove that its derivative \( h'(u) \geq 0 \) for \( u \in (0,1] \). But,
\[ h'(u) = \frac{1}{u^{2HK}} \left( -2(K - 1)H(u^{2H} + 1)^{K-2}u^{2H-1} + (1 - u)^{2HK-2}(2HK - 1) \right). \]

Observe that \( u^{2H-1} \leq 1 \) because \( H \in (\frac{1}{2}, 1) \), \( (u^{2H} + 1)^{K-2} \leq 1 \) and
\[ (1 - u)^{2HK-2} \geq 1. \]

So,
\[ h'(u) \geq \frac{1}{u^{2HK}} (-2(K - 1)H + 2HK - 1) = \frac{1}{u^{2HK}} (2H - 1) \geq 0, \]
because \( H \geq \frac{1}{2} \). The prove is now complete. \( \square \)

Proposition 2.7. Suppose that \( H \in (0,1) \), \( K \in (1,2) \) such that \( HK \in (0,1) \).
The bifBm \( B_{H,K} \) has the following properties
i) \( B_{H,K} \) is a self-similar process with index \( HK \), i.e.
\[ \left( B_{H,K}^{a,t}, t \geq 0 \right) \overset{d}{=} \left( a^{HK} B_{1,t}, t \geq 0 \right), \quad \text{for each} \ a > 0. \]

ii) \( B_{H,K} \) has the same long-range property of the fBm \( B_{HK} \), i.e. \( B_{H,K} \) has the short-memory for \( HK < \frac{1}{2} \) and it has long-memory for \( HK > \frac{1}{2} \).

iii) \( B_{H,K} \) has a \( \frac{1}{HK} \)-variation equals to \( 2^{\frac{1}{HK}} \lambda t \) with \( \lambda = E(|N|^{\frac{1}{HK}}) \) and \( N \) being a standard normal random variable, i.e.
\[ \sum_{j=1}^{n} \left( B_{H,K}^{t_j} - B_{H,K}^{t_{j-1}} \right)^{\frac{1}{HK}} \overset{\text{in} \ L^1(\Omega)}{\longrightarrow} 2^{\frac{1}{HK}} \lambda t \]

where \( 0 = t_0 < \ldots < t_n = t \) denotes a partition of \( [0,t] \).
iv) $B^{H, K}$ is not a semimartingale if $2HK \neq 1$.

The proof of the proposition 2.7 is straightforward from [12] and [6].

3. Space of integrable functions with respect to bifractional Brownian motion

Let us consider $\mathcal{E}$ the set of simple functions on $[0, T]$. Generally, if $U := (U_t, t \in [0, T])$ is a continuous, centered Gaussian process, we denote by $\mathcal{H}_U$ the Hilbert space defined as the closure of $\mathcal{E}$ with respect to the scalar product

$$\langle 1_{[0,t]}, 1_{[0,s]} \rangle_{\mathcal{H}} = E(U_t U_s).$$

In the case of the standard Brownian motion $W$, the space $\mathcal{H}_W$ is $L^2([0, T])$. On the other hand, for the fractional Brownian motion $B^H$, the space $\mathcal{H}_{B^H}$ is the set of restrictions to the space of test functions $D((0, T))$ of the distributions of $W^{1/2-H, 2}(\mathbb{R})$ with support contained in $[0, T]$ (see [8]). In the case $H \in (0, \frac{1}{2})$ all the elements of the domain are functions, and the space $\mathcal{H}_{B^H}$ coincides with the fractional Sobolev space $H^{1/2-H, 2}(L^2([0, T]))$ (see for instance [5]), but in the case $H \in (\frac{1}{2}, 1)$ this space contains distributions which are not given by any function.

As a direct consequence of Theorem 2.3 we have the following relation between $\mathcal{H}_{B^H, K}$ and $\mathcal{H}_{X^{H, K}}$, where $B^{H, K}$ is the bifractional Brownian motion and $X^{H, K}$ is the process defined in (2.3).

**Proposition 3.1.** Let $H \in (0, 1)$ and $K \in (1, 2)$ with $HK \in (0, 1)$. Then it holds that

$$\mathcal{H}_{X^{H, K}} \cap \mathcal{H}_{B^{H, K}} = \mathcal{H}_{B^{H, K}}.$$

If we consider the processes appearing in Proposition 2.5 we have also the following result:

**Proposition 3.2.** Let $H \in (0, 1)$. For every $K \in (0, 2)$ with $HK \in (0, 1)$ the following equality holds

$$\mathcal{H}_{X^{H, K}} \cap \mathcal{H}_{B^{H, K}} = \mathcal{H}_{B^{H, K}} \cap \mathcal{H}_{B^{H, K}}.$$

**Proof.** Both propositions are a direct consequence of the two decompositions into the sum of two independent processes proved in Theorem 2.3 and Proposition 2.5. □

**Remark 3.3.** For the case $K \in (0, 1)$ we have the following equality (see [10])

$$\mathcal{H}_{B^{H, K}} = \mathcal{H}_{X^{H, K}} \cap \mathcal{H}_{B^{H, K}}.$$

4. Weak convergence towards the bifractional Brownian motion

Another direct consequence of the decomposition for the bifractional Brownian motion with $H \in (0, 1)$, $K \in (1, 2)$ and $HK \in (0, 1)$ is the following result of convergence in law in the space $C([0, T])$.

Recall that the fractional Brownian motion of Hurst parameter $H \in (0, 1)$ admits an integral representation of the form (see for instance [1])

$$B^H_t = \int_0^t K^H(t, s)dW_s,$$
where $W$ is a standard Brownian motion and the kernel $K^H$ is defined on the set \( \{ 0 < s < t \} \) and given by

\[
K^H(t,s) = d_H(t-s)^{H-\frac{1}{2}} + d_H \left( \frac{1}{2} - H \right) \int_s^t (u-s)^{H-\frac{1}{2}} \left( 1 - \left( \frac{s}{u} \right)^{\frac{1}{2}-H} \right) du,
\]

(4.1)

with $d_H$ the following normalizing constant

\[
d_H = \left( \frac{2H \Gamma\left( \frac{3}{2} - H \right)}{\Gamma\left( H + \frac{1}{2} \right) \Gamma\left( 2 - 2H \right)} \right)^{\frac{1}{4}}.
\]

Theorem 4.1. Let $H \in (0,1)$ and $K \in (1,2)$ with $HK \in (0,1)$. Consider $\theta \in (0,\pi) \cup (\pi,2\pi)$ such that if $HK \in (0,\frac{1}{4}]$ then $\theta$ satisfies that

\[
\cos((2i+1)\theta) \neq 1
\]

for all $i \in \mathbb{N}$ such that $i \leq \frac{1}{H} \left[ \frac{1}{H} \right]$. Set $a = \sqrt{2^{1-K}}$ and $b = \sqrt{\frac{K(K-1)}{2^{2H}(2-K)}}$. Define the processes,

\[
B_{\epsilon}^{HK} = \left\{ \frac{2}{\epsilon} \int_0^T K^{HK}(t,s) \sin\left( \theta N_{\epsilon s} \right) ds, \ t \in [0,T] \right\},
\]

\[
X_{\epsilon}^{H,K} = \left\{ \frac{2}{\epsilon} \int_0^\infty \left( 1 - e^{-st^{2H}} \right) s^{-\frac{1+K}{2}} \cos\left( \theta N_{\epsilon s} \right) ds, \ t \in [0,T] \right\},
\]

where $K^{HK}(t,s)$ is the kernel defined in (4.1). Then,

\[
\{ Y_{\epsilon}^H(t) = aB_{\epsilon}^{HK}(t) + bX_{\epsilon}^{H,K}(t), t \in [0,T] \}
\]

weakly converges in $C([0,T])$ to a bifractional Brownian motion.

Proof. Applying Theorems 3.2 and 3.5 of [2] we know that, respectively, the processes $B_{\epsilon}^{HK}$ and $X_{\epsilon}^{H,K}$ converge in law in $C([0,T])$ towards a fBm $B^{HK}$ and to the process $X^{H,K}$. Moreover, applying Theorem 2.1 of [2], we know that the limit laws are independent. Hence, we are under the hypothesis of the decomposition obtained in Theorem 2.3, which proves the stated result.

Remark 4.2. Obviously we can also obtain the same result interchanging the roles of the sinus and the cosinus functions in the definition of the approximating processes.

Acknowledgment. The authors would like to thank the editor Hui-Hsiung Kuo and referees for the valuable comments.
